**Abstract.** The objective of the article is to study the perception of medical doctors by Hindu, Russian and Kazakh linguoculture bearers by means of cognitive analysis of association data obtained from the psycholinguistic experimental study conducted among Hindi, Russian and Kazakh native speakers. Methods of the research include a free association experiment with a stimulus words *ডাক্তার* in Hindi,  *враچ* in Russian, and *әӘрізеп* in Kazakh, modelling the associative field DOCTOR and its cognitive structure, defining the universal and ethno-specific features of medical doctors as perceived by the representatives of Indian, Russian and Kazakh nations. The obtained associative data were distributed according to the frequency criterion, followed by content analysis and categorization. As a result, while comparing association fields in Hindi, Russian, and Kazakh languages the quantitative asymmetry of semantic zones and their associates is revealed. Conceptualization of medical doctors in the Hindu, Russian and Kazakh language consciousness includes both universal and ethno-specific features. The results of the study integrate the experiences of different nations simplifying the perception of their peculiarities, and may have a positive impact on cross-cultural interactions.

**Keywords:** medical doctors, Hindi, Russian, Kazakh, free association experiment, language consciousness, conceptualization

**Аннотация.** Целью статьи является исследование восприятия врачей представителями индийской, русской и казахской наций посредством когнитивного анализа ассоциативных данных, полученных в результате психолингвистического исследования, проведенного среди носителей хинди, русского и казахского языков. Методы исследования включают свободный ассоциативный эксперимент с предъявлением респондентам слов-стимулов  (хинди), *врач* (рус.) и *дәрігер* (каз.), моделирование ассоциативного поля ВРАЧ и его когнитивной структуры, определение универсальных и этноспецифических признаков врачей в восприятии представители индийского, русского и казахского народов. Полученные ассоциативные данные были распределены по критерию частотности с последующим контент-анализом и категоризацией признаков. При сравнении ассоциативных полей в хинди, русском и казахском языках выявляется количественная асимметрия семантических зон и их ассоциатов. Концептуализация врачей в индийском, русском и казахском языковом сознании включает в себя как универсальные, так и этноспецифические черты. Результаты исследования интегрируют знания разных народов, упрощая восприятие их особенностей, и могут оказать положительное влияние на межкультурные взаимодействия.

**Ключевые слова:** врач, хинди, русский язык, казахский язык, свободный ассоциативный эксперимент, языковое сознание, концептуализация

## Introduction

Reference to materials of word association tests has gained a particular relevance for the studies with cognitive focus [1]. An association experiment sheds light on human linguistic consciousness and subjective-intuitive world outlook, which is not usually perceived by the native speakers and is not revealed by other research methods, and it has proved to be a reliable tool in psycholinguistics to explore the psychological, categorical, and substantive meaning of words [2—12].

Linguistic consciousness, synonymous to “the image of the world” [13] represents mental images having linguistic equivalents that reflect cultural and mental peculiarities and moral standards of a specific community. This makes linguistic consciousness a tool not only for psychological and linguistic analysis but also for the analysis of cultural perspectives of a community [14]. Thus, the importance of the association experiment in the cross-cultural ethnic language consciousness studies increases day by day.

Uncontrolled associations are a direct projection of internal content of consciousness. They represent the phenomenon of mass consciousness and are able to identify convincingly the national and cultural specifics of the images of consciousness of speakers of different language communities and cultures [15]. Associations act as “a logical link in the contents of consciousness — sensations, perceptions, thoughts, feelings, etc. — in the person’s experience, proving that the appearance in the mind of one of contents entails the appearance of another” [16].

Association field is a specific cognitive structure of the linguistic consciousness, which is involved in the forming of the conceptual picture of the world [17]. Semantic gestalt of an association field [18] reconstructs the knowledge about the surrounding world in the linguistic consciousness of native speakers by means of dividing the reactions of one association field into several semantic zones each of which covers similar features of an object or a phenomenon.

Thus, the data obtained through an association experiment can be interpreted as a consciousness reflection of representatives from different cultures, and is going to reveal the national and cultural specificity of a particular ethnus.

The study is aimed at describing Indians’, Russians’ and Kazakhs’ conceptualization of medical doctors. Being a universal concept inherent in any nation and “an integral part of any modern society” [19], *medical doctor*, verbally represented by the lexemes “ডাক্তর” in Hindi, “врач” in Russian, and “дәпіреп” in Kazakh, is of undoubted interest for research. It is one of the key concepts of the medical discourse, forming the structure of the whole category [20]. The relevance of the study is defined by the interest in one of the key concepts during the times of COVID-19 pandemic and post-pandemic period, the significance of the intersection between culture and language, and the possibility to describe the content and structure of conceptualization of *medical doctors* in Hindi, Russian and Kazakh languages. Study of perceptions of the

concept under study by the Indians, Russians and Kazakhs contributes to fixing the constants of ethnic consciousness and culture, determines the importance and place of medical doctors in lives of the representatives of these ethnic groups.

## **Data and Methodology**

A psycholinguistic study was conducted among the native speakers of Hindi, Russian and Kazakh languages. Verbal associations were collected by means of a free association experiment which represents the specifics of a certain language or culture bearers' consciousness [21]. The experiment was conducted online, the survey was administered by providing links to Google Forms.

Participants of a free association experiment received the stimulus word *doctor* in their native language (डॉक्टर/ врач/дәрізеп) to provide verbal reactions. The respondents were asked to state the first associations with it that came to mind. The number of responses was not limited.

A total of 300 people (aged 17—23) took part in the experiment. The Russian native speakers were 100 students at Orenburg State Pedagogical University (Russian Federation). The representatives of Indian ethnos comprised of 100 international students of the West Kazakhstan Marat Ospanov Medical University. The Kazakh respondents consisted of 100 students of K. Zhubanov Aktobe Regional University (Republic of Kazakhstan).

The association field DOCTOR and its contents in three languages were identified and further on categorized based on the calculation of indices of verbal associations.

## **Data analysis and Discussion**

As a result of the free association experiment, 691 associative responses were received from the representatives of the Kazakh ethnos, 531 — from Indians, and 515 — from Russians. Kazakh students' responses exceed the responses of Indians and Russians by nearly 30 %.

Based on the frequency of lexical associations, the association field (AF) including the centre (identified by reactions from more than 20 subjects), the near periphery (identified by reactions from 10 to 20 subjects), the far periphery (identified by reactions from less than 10 subjects), and the outer periphery (individual associates) were determined.

The AF structure in three languages is as follows: in Hindi — 103 components, of which 39 components are stated only once (individual associations (IA), in Russian — 181 (124 IA), and in Kazakh — 307 (212 IA).

Features of *medical doctors* as perceived by the Indian ethnic group are presented in the form of the AF DOCTOR in Table 1.

Table 1 / Таблица 1

## The AF डॉक्टर / Ассоциативное поле डॉक्टर

Centre (more than 20)	री / surgery (24), चार / communication (21), रोगी का इतिहास / patients' history (20)
Near periphery (10-20)	प्रेर्चे / prescription, असुविधाजनक महसूस / uncomfortable feeling (19), उपचार / treatment (17), औपरेशन टूल्स / operation tools (16), नदिन / diagnose (15), सफेद एप्सन / white gown (13), स्टेप्सेकोप / stethoscope (13)
Far periphery (less than 10)	अच्छा व्यवहार / good behavior, अस्पताल / hospital, ऑक्सीजन मस्क / oxygen mask (9), मेहरबान / kind, सानायमामीटर / sphygmomanometer, दर्वा / medicine, अपरेशन थीटिर / operation theatre, बीमारी / illness, थर्मोमीटर / thermometer (8), मूल्यांकन / evaluation (7), ईसीजी / electrocardiogram, साहन्तुर्फूटी / empathy, दर्दार / helpful, सो जाओ / sleep, आवास चाकिटेस्क / residency doctor (6), डॉक्टर अच्छे सरबाब हैं / good nature, जूबान / knowledge, उत्तरदायी / responsible, ईर्य / calm (5), इंजेक्शन / injection, आत्मविश्वासी / self-confident, एप्टी पर डॉक्टर भगवान / doctor — god on earth, सहायक / helper (4), अच्छा / communicative skill, समर्पयते / dedicated, लोगों के प्रति उत्कृष्ट व्यवहार / excellent behavior towards people, प्रेरक / motivational, वर्तमास / polite, आदरशील / respectful, समसान लोग सरसाय, बीमारी / respect people, healthy, ill, जामिनदार / responsible, तरीत / respectful, सामाजिक / social, समरथन रोगधियों और उनके प्यार / support patients, सांताना / sympathetic, लालची / greedy (3), सकराये / active, सहायक / assistant, मलिनसार / communicative, अछी सुनने की शमनता / good listener, शरोता / the best listener, अच्छी बातचीत करने वाला / well communication, करतवय के लिए ईमानदार / conscientious to duty, ईश्वर / god, अच्छा इसान / good human, अच्छा व्यक्तिगति / good personality, बुद्धिमत्ता / intelligent, दयालु सर्वभवति / kind nature, खुले दामा / open mind, सकारात्मक सोच / positive thinking, हमेशा साकारात्मक सोच / always think positive, पैशवर / professional, वास्तव्य के रूप में अच्छी तरह से इलाज बीमारों को बहाल करने के / promote health as well as treat disease, समय का पांचनांद / punctuate of time, मरीजों को अंतरिक्त समय / works over time for the patient, इण्जनियर / respected, गैरजिमिस्टर / irresponsible, लापरवाह / careless, अच्छी समप्रक योग्यता / good communication skills (2)
Outer periphery Individual associations	अच्छे से सुनने वाला / active listener, हमेशा धन के लिए काम करना / always work for money, जागरूकता / attention, चौकस / attentive, सावधान / capable, सावधानी से / पहले मरीजों की सोचने वाला (1) / before thinking of himself he/she should take care of patient, खुली सोच वाला / broad-minded, सक्षम / capable, सारथानी से / careful, देखभाल करना / caring, भरियेबन्द (1) / comforter, मजबूत कौशल संताद / strong मजबूत संवाद / strong communication, रोगी के साथ के बारे में अच्छा संचार / good communication with patient, दयालु / compassionate, सक्षम / competent, एकार्यात्मक दास्तान / cooperative, रोगी के साथ सहयोग करना / cooperate with patient, अनुशासन / discipline, अशासन / unconstrained, अशासन / unconstrained, रोगी के साथ सहयोग करना / cooperate with patient, अनुशासन / discipline, मदद लोगों वाश्वास ही सकता है / can be confident to patient, शायक / cooperative, रोगी के साथ सहयोग करना / cooperate with patient, अनुशासन / discipline, मदद लोगों तक पहुँचने के लिए आसान / easy to reach to help people, शिक्षित / educated, प्रस्तावी / effective, दक्षता / efficiency, भावान के लिए सहनुप्रीति / empathy for feeling, हर समय मुस्कान / every time smile, आगों की सोचने वाला / forward thinker, दास्तान / friend, अनुकूल / friendly, नाशिका साथ है / give unbiased advice, अच्छा धान लेने के कौशल / good attending skill, सावा सर्वधारा / normal behavior, अच्छा व्यवहार / well behavior, मरीज की अच्छी देखभाल प्रदान / good care provider of the patient, अच्छा नेदानिक (good diagnostic), अच्छी अदेत / good habits, डॉक्टर एक अच्छी अदेत है / doctor is a nice man, एक अद्युत्ता इसान / nice human being, मन ठाक नहीं है / feelingless, लोगों के प्रति उत्कृष्ट व्यवहार / good inspired person, रोगी के खलिफ रूपकर्ता / reputed person, रोगी के अच्छा व्याचार / good thought about patient, इण्जनियर / highly qualified, इमानदार / honest, अपराधी / inattentive, उच्च वेतन / high salary, माननीय / honourable, नम्र / humble, समाज में ढंपकूर के महत्व / importance of doctors in society, दयालु व्यक्तिगति / kind attitude, जिमिदारी ऐप्सी / low responsibility, कोई व्यक्तिगती जीवन / no personal life, वाश्वास नहीं / not confident, रोगी / nurse, मणहम / ointment, सर्कर / patience, धोणी भी सर्थी की समालने वाला (1) / perfect in handling any situation, अच्छा / personal characteristics, शाष्ट्रियात्मक प्रक्रिया / polite, त्याक्षयाचिता / professionalism, अदरशीय / satisfactory, लोगों के प्रति उत्कृष्ट व्यवहार / respective behavior for people, समाज में सबसे समसानाति व्यक्ति / the most professional person in society, सतोषजनक / sincere, समार्ट / smart, मजबूत (1) / strong, मजबूत साक्ष / strong witness, दरमिया / super-fast mind, सर्ववेतन उपलब्ध जानकारी लाने वाला / support people with best available information, मरीज की भावना को समझना / understand patients feeling, अच्छी तरह से मोनोविजिजन के बारे में जज्जान / well knowledge about psychology, सुयोग्यता प्राप्त / well-qualified, सर्वसंथय देखभाल दीनी के अन्य सरसाय के साथ मतिकर काम करना / work cooperative with other members of healthcare team

Source: authors' elaboration based on the association experiment

By the representatives of Indian ethnus, *medical doctors* are mostly associated with the following notions: *communicative* (31.1%), *surgery* (23.3%), *patients' history* (19.4%), *uncomfortable feeling*, *prescription* (18.5%), *treatment* (16.5%), *diagnosis* (14.6%), *good nature* (12.6%), *stethoscope* (12.6%), *white gown* (12.6%), *good behaviour* (11.7%), *kind* (10.7%), *helper* (9.7%), *oxygen mask* (8.7%), *hospital* (8.7%).

Features of *medical doctors* as perceived by the Russian ethnic group are presented in the form of the AF DOCTOR in Table 2.

As perceived by Russians, *medical doctors* are associated with a *white gown* (9.3%), *hospital* (7.4%), *help* (6.8%), *treatment* (4.1%), *health*, *illness* (3.1%), *drugs*, *save lives* (2.7%), *physician*, *injection* (2.1%).

Features of *medical doctors* as perceived by the Kazakh ethnic group are presented in the form of the AF DOCTOR in Table 3.

According to the Kazakhs, *medical doctors* are associated with *hospital* (4.4%), *white gown* (4.1%), *patients* (2.8%), *remedy* (2.6%), *educated* (2.2%), *cleanliness* (2.02%), *noble* (1.7%), *kind* (1.4%).

The comparative core-near periphery structure of the AF DOCTOR in three languages structure is presented in Table 4.

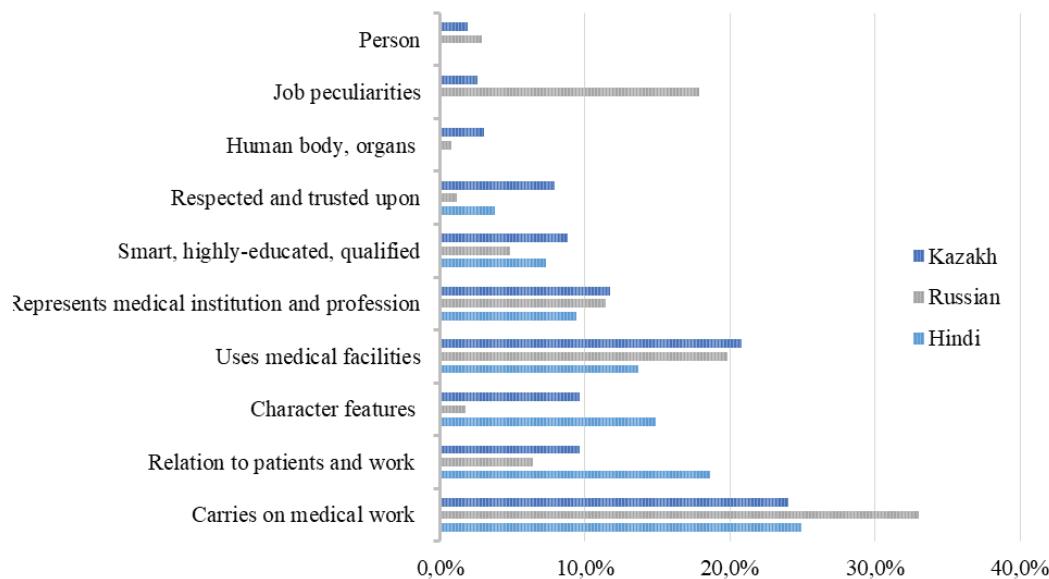

Table 4 / Таблица 4  
**Centre-and-near periphery structure of AF *Доктор/ВРАЧ/ДЭРІГЕР / Структура АП *Доктор/ВРАЧ/ДЭРІГЕР****

AF components	Hindi (N)	Russian (N)	Kazakh (N)
<b>Core</b>	surgery (24), communication (21), patients' history (20)	white gown (48), hospital (38), (ambulance) help (35), treatment (21)	hospital (22), white gown (21)
<b>Near periphery</b>	prescription, uncomfortable feeling (19), treatment (17), operation tools (16), diagnose (15), white gown (13), stethoscope (13)	health, illness (16), drugs, rescuer / saves lives (14), physician, injection (11)	medicines (18), cleanliness (14), injection (13), phonendoscope, patient (12)

Source: authors' elaboration based on the association experiment

The common and specific components identified in the associative meaning to the stimulus *doctor* (*Доктор/врач/дәрігеп*) are due to differences in the structures of languages and the ethnic specificity of Indian, Russian, and Kazakh cultures.

Features of *medical doctors* obtained as a result of the association experiment in three languages were categorized forming the semantic zones without remainder (Fig. 1).

**Fig. 1.** Categories in Hindi, Russian and Kazakh languages

**Рис. 1.** Категории на хинди, в русском и казахском языках

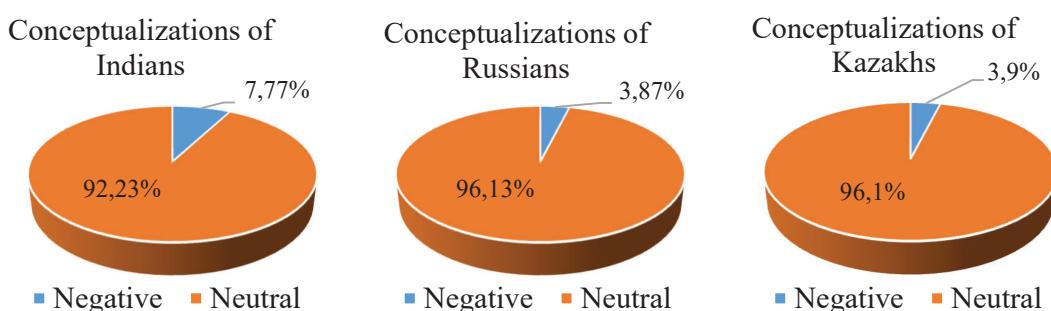

The most voluminous category in the association field DOCTOR as perceived by all three ethnic groups is “*Carries on medical work*” (in Hindi — 132 (24.9%), in Russian — 170 (33%), in Kazakh — 166 (24.02%).

As perceived by the Hindu linguoculture bearers, *medical doctors* are further associated according to their relation to patients and work — 99 (18.6%), character features — 79 (14.9%), using of medical facilities — 73 (13.7%).

Russians mostly perceive *medical doctors* as using medical facilities — 102 (19.8%), having specific job peculiarities — 92 (17.9%), and their relation to patients and work — 33 (6.41%).

Kazakhs’ perceptions of *medical doctors* are mostly associated with the use of medical facilities — 144 (20.8%), work at medical institutions and holding medical profession — 81 (11.7%), character features and relation to patients and work — 66 (9.6%).

The results of the axiological analysis of conceptualizations of *medical doctors* by the representatives of Indian, Russian and Kazakh nations identified negative perceptions of *medical doctors* (Fig. 2).

**Fig. 2.** Ratio of negative conceptualizations of medical doctors

**Рис. 2.** Соотношение негативных характеристик

Negative perceptions of *medical doctors* by Indians include the following notions: *greedy* (3), *careless, irresponsible* (2). According to Russians, *medical doctors* are *rude, inadvertent, deceitful, detached, negligent, callous, and executioners*. Negative features of a doctor according to Kazakhs, are *money-loving* (2), *corruption* (2), *greedy, rudeness, haughtiness, inattentiveness, malpractice, severity, cruelty, low knowledge, illiteracy, inability to diagnose and treat, death caused by a doctor*.

*Medical doctors* are conceptualized by the representatives of Indian ethnoses mostly as communicative, kind helpers with good behaviour and good nature, wearing a white gown with a stethoscope, working in surgery, a hospital with patients’ history, prescriptions, diagnosing and treating, sometimes causing an uncomfortable feeling.

As perceived by Russians, *medical doctors* wear a white gown, work in a hospital, where they help to preserve health, treat illness, prescribe drugs, injections, and save lives.

The significant features of *medical doctors* for Kazakh language consciousness are hospital, white gown, patients, remedy, educated, cleanliness, noble, kind.

### Concluding remarks

Summing up the conceptualization of *medical doctors* by the representatives of Indian, Russian and Kazakh nations actualized from the data of the word association experiment, the conducted study proved to be an effective tool in determining the specifics of ethnic language consciousness.

The results of the study define the differences and commonalities in perceptions of *medical doctors* in Hindu, Russian and Kazakh linguistic mentality according to the constants identified in the ethnic language consciousness.

As a result of the study, it was revealed that the concept under study is of the utmost significance in the consciousness of the studied ethnic groups, and it is especially noticed from the variety of words-associations and cognitive features in those three languages. Informational, communicative and functional features of *medical doctors* are most actualized in the language consciousness of respondents. *Medical doctors* are conceptualized by Indians, Russians and Kazakhs as highly qualified specialists with high moral qualities, related to medical activity and respected in society.

The results of the study simplify the perception of *medical doctors* from the cross-cultural perspective, and may have a positive impact on intercultural communication.
